**List of functions not working correctly**

1. Occasionally, when trying to open up the drawer on the *list view* page, swiping back takes the user back to an older version of the *list view* page instead of opening up the drawer.
2. When running the SPACE app on an android emulator, there are some warnings in regards to the `setState` function.
3. When running the SPACE app in a location where GPS signal is weak, the *map view* page will not display the user's location correctly, and will display an error message.
4. When a user checks into a poster's listing, just as that poster deletes the listing, firebase will not update on time and will attempt to check the user into a 'null' spot, which crashes the app.
